

AI workflows for documents and operations

We build AI workflows that extract facts, retrieve source material and produce work people can review. We connect them to existing applications, with clear rules for human approval.

WHAT WE DELIVER

Document extraction, search and review

Extract facts from PDFs, retrieve relevant records and compare information across documents. Return source-linked findings for human review, scoped to a specific document set and business decision.

Workflow automation and system integration

Generate documents from existing records, route drafts for approval and update connected applications. Combine AI with deterministic rules and API integrations.

EXPERIENCE BEHIND THE PRACTICE

Selected experience from our principal's product and engineering roles before AIVG.

Property intelligence and underwriting | 770 / CenterPoint

Combined property and market records for deal review. Built valuation models, underwriting calculations covering acquisition costs, rent, vacancy and net yield, and automated transaction-document generation.

Clinical records and claims | ClinicSource

Led development across therapy scheduling, clinical documentation and billing. Built secure record-sharing software and an automated claim-download service for internal billing work.

AI product integration and menu systems | Grubrrr

Shipped AI/LLM features within existing product workflows. Built digital menu-board software connected to APIs and databases, and coordinated kiosk implementations with engineering and customer teams.

HOW WE WORK

Start with a workflow, written scope and acceptance criteria. Delivery includes working software and documentation. The senior engineer who scopes the work also builds it.

Fully remote, part-time engagements for businesses and agency partners. Meeting windows, weekly capacity and support responsibilities are agreed before work starts.

Engagements exclude gift cards, stored value, prepaid, loyalty programs and payments.
